WHY PLANT GRAFTED EVERGREENS?

Evergreens, like other varieties of trees, are constantly being improved, and we have devoted a number of years to producing trees that are outstanding in color and habit of growth. To obtain these results, we graft from trees that we have carefully selected and held under observation long enough to prove their superior qualities. In these grafted types only it is possible to have perfect mates as to color of foliage and uniformity of growth. In the common or seedling types, even though perfect mates when selected, it is almost impossible to keep them identical—eventually one will outgrow the other or the foliage will vary enough to be noticeable. Where identical mates in evergreens are desired, we advise planting GRAFTED types.

HETZI. A spreading type of evergreen resembling Juniper Pfitzer in habit of growth with silver-green foliage. Grows quite rapidly, stands shearing well, and makes up into a splendid compact evergreen. Often called Silver Pfitzer.

Plant Bare Root Trees Immediately

Have your ground ready by the time your trees arrive. Do not expose the roots to the air. After unpacking the shipment, put the roots into a tub of water or thin mud and soak them for about one hour. Take out one tree at a time from the tub; then holding the tree in place with one hand, fill the hole about three-fourths full with soil, packing firmly. Water thoroughly, and when it has soaked in fill up the remainder of the hole. Top dress with well rotted barn-yard manure or pulverized sheep manure. DO NOT use Chemical Plant Food on newly planted nursery stock.
